## Take Visual Inspection to the Next Level with ATS Inspect

*Defect-driven warranty claims can devour your profit margins. Find out how ATS Inspect can reduce and eliminate those claims by ensuring your product leaves the plant defect free.*

### 3D Inspection

Defects can be placed directly onto 3D CAD models. All major CAD formats are supported allowing you to import your existing models. The name and ID of every component within the model can also be imported into the database which will greatly reduce your setup time.

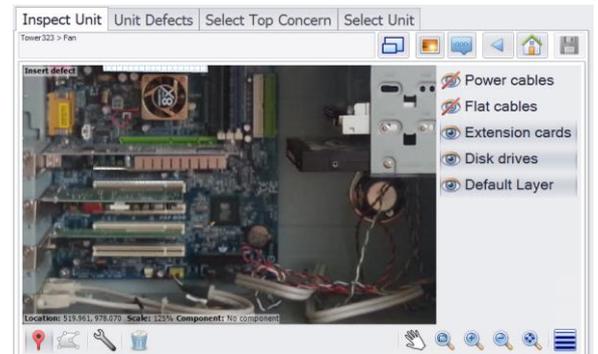

When you need to add a defect you can smoothly rotate the model zoom in to the required area and assign the defect.

The operator can jump to bookmarked perspectives with cut-throughs and with components removed so that they can place defects inside the product without the need for multiple views and photos to be taken.

### Layered Inspection

The operator can place defects on multi-layer views. This allows them to strip away information to see *inside* the object being inspected.

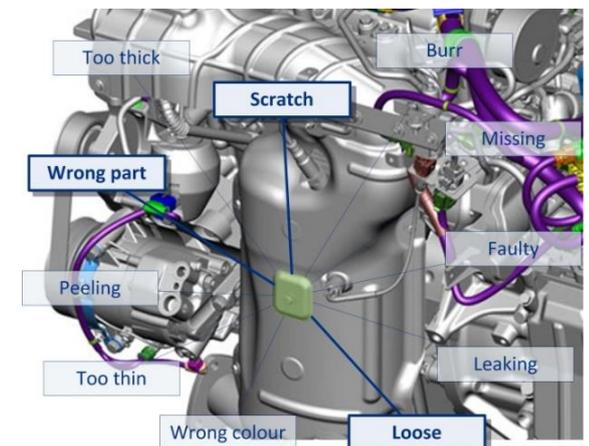

For example, if you were inspecting the interior of a car door you could have layers that represent the door panel, wiring harness behind the door panel and finally the shell of the door.

This layered approach speeds up data collection which reduces costs and means no defect can remain hidden for long.

### A Data Collector That Learns

The list of concerns associated to each part can be created at runtime by the operator, greatly reducing the configuration time.

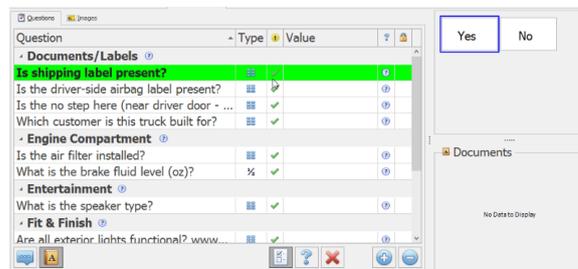

When an operator first tries to highlight a defect they'll be presented with all available concerns. Once they've selected the concern and created the defect that concern is associated to the component.

Once enough data has been collected an administrator can create the final list of concerns for each component based on the associations that have already been made on the production line. In effect we have created a self-learning configuration ability.

## Eliminate Paper Checklists

ATS Inspect includes electronic checklists that can be used to record issues and to make sure all required visual and option content checks have been completed. This eliminates paper checklists and the difficulty of preserving, retrieving and using checklist data for later review and analysis.

## Instant Event Notification

ATS Inspect lets you instantly inform personnel of the current state of quality throughout the production facility.

Whether it's a regular update or a quality issue alert, ATS Inspect will be able to let the right people know right away via e-mail and static display devices, such as message boards and overhead monitors.

The criteria for an alert and the information the alert contains are highly configurable but could involve the following:

- ▶ Quality thresholds
- ▶ Production thresholds
- ▶ Critical defects
- ▶ Production statuses

## Take a Picture

You can take a photo of a quality concern and store it alongside the defect in the system. This gives you a true record of what's happening on the production line.

## Customizable User Interfaces

Every company is unique and there will even be different requirements between the different workstations within each company. To allow for this ATS Inspect lets you design your user interfaces from scratch.

Place the controls where you need them and then modify the look and feel as you require. You can have different user interfaces for different stations that are designed around the requirements of each location.

And you aren't limited by the functionality within ATS Inspect. The open architecture allows you to add event-driven logic to your end-user interfaces giving you all the power you need to customize the application behavior.

## Advanced Reporting Services

ATS Inspect comes with over 70 pre-defined reports that are available through ATS Advanced Reporting Services (ARS), our powerful reporting and analysis tool that builds on the strengths of Microsoft SSRS ©.

The web-based reports can be viewed anywhere in the world and If the available reports don't fulfil your needs you can create your own, calling on all the data available within ATS Inspect as well as from other sources.

Using ATS ARS you'll be able to save a report with different configurations so that you call it up easily and compare and contrast different sets of parameters. You can also automatically generate and send reports via email at regular intervals.

Reports can also be viewed in the data collection applications. These reports, presented at the point-of-origin, will allow operators to see trends emerging in real time.

For example, if a machine is slowly moving out of alignment, causing increasing numbers of defects, then the operator at the machine can see it happening and fix the problem before it gets any worse.

## Taking it Step by Step

Product inspections can vary enormously. A single unit may have hundreds or thousands of attributes that need to be checked.

ATS Inspect is prepared for this and allows you to set up inspection steps that will guide the operator through the process in a structured, methodical manner. Checklist questions can be asked at each step to ensure that nothing is overlooked.

## Multiple Language Support

The language displayed at each station is tied to the current user, so that employees who speak different languages can operate efficiently throughout a facility. In addition, reports can be viewed in different languages at the local facility and the global headquarters.

## Mobile Checklist

Using a handheld device an operator can carry out final checks on a product before it leaves the plant. Once the serial number of the unit has been entered, a tailor-made checklist will be presented to the operator, allowing them to confirm that any customer-requested features have been correctly installed.

## Mobile Repair

Carrying out repairs should never become a complication. It's important that they are carried out completely and efficiently – nothing missed, nothing forgotten. ATS Inspect allows you to do this.

Carrying a handheld device, an operator can move freely around the line performing repairs then simply identify the corrected defect on a repair ticket when it is done. A second operator can then confirm the repairs have been carried out using a similar device.

Total Defects = 6, Open Defects = 4      Printed At 5/4/2008 10:50:02 AM      Page 1/2

A typical ATS Inspect travel ticket

These double-checks are instantly stored in the system meaning that no open defects get through and the customer will only ever see the product the way you intended it.

## Data Management Tools

Users can import parts, locations, concerns, details, repair types and product data directly into the ATS Inspect database. This eliminates the need for manual data entry of information already stored in other databases or files.

## See the Cost of Quality

You know that ATS Inspect delivers information on the quality of your products, but what about the cost?

ATS Inspect allows you to see the cost of quality. You can calculate the repair cost of each product or how much labour and material cost is tied up on the plant floor at a given time.

## Reference Documents

It's often useful to have some extra information about how to carry out an inspection. This is where Reference Documents come in handy. Operator instructions, visual aids or whatever else you may need can be accessed by the operator when they need them most.

## Open Architecture

The use of public Application Programming Interfaces (APIs), exposed through our Web Services, allow better integration with your other systems.

These machine-to-machine interfaces will allow you to access and exchange data with ATS Inspect with the minimum of hassle, presenting greater opportunities for system integration and automation.

## Part of the ADOS Suite

ATS Inspect is part of the ADOS (Attribute, Dimensional, Operational and Shared) software

suite. ATS ADOS gives you world-class data collection, reporting and analysis while its cross-application integration provides endless avenues along which to develop and expand your manufacturing potential. Find out more about ATS ADOS on our [website](#).

ATS is an **Independent Solution Provider**, with over 30 years' experience in the manufacturing systems arena and a wealth of experience undertaking Continuous Improvement initiatives and Manufacturing IT solution design, deployments and 24/7 support assignments.
